1. Place the green testability post-it notes into the categories, you believe they belong to.
2. In a different colour to green/yellow, add your own questions to each testability category.
3. Place the yellow automatability post-it notes into the categories, you believe they belong to.
4. In a different colour to green/yellow (and your chosen testability), add your own question to each automatability category.

The 10 P's of Testability

© 2019 Robert Meaney
@robbiemeaney

[Return to Day 1 activity home page]	People	Philosophy	Product	Process	Project	Problem	Pipeline	Productivity	Production issues	Proactivity
Testability	Who has all the product knowledge? Other testers to gain knowledge and resources? Does the whole team check automation builds, maintain & ownership? What testing skills do the team have? Are the developers encouraged to do exploratory testing?	Does the whole team take responsibility for testing?	How easy is it to create test data? How do we verify with the customer's expectations? What are our requirements / acceptance criteria? Can we add hooks and create smaller, more testable chunks? What technologies are used for this product? (Do we have the tools?) Could we affect other features / products?	Who is involved in story planning? How often does the team have retrospectives? How do customers report issues in production?	Are stories adequately broken down? Does the project have a deadline? Does the project have a deadline? Any project risks?	What risks are currently the most important? Do you know who your customers are?	How many test environments are there? How long does a build currently take? What are the steps fo the currently CI system? What is the mean time to discovery for high impact bugs? Do testing builds stop the pipeline? Release timing (risk, dark, pilot, UAT)? Release process & ease	How much testing is done as early as possible?	How many known bugs are currently in production?	Is the team actively encourage to experiment?
Automatability	What automation tools does the team have experience with? Who is going to be maintaining the automated checks?	Is there a big backlog of things waiting to be automated? Is the team open to new tooling? Do the developers contribute to the quality of the automated check code? Does the whole team contribute to automated checks?	Do we know what flows the customers value the most? Does the UI have identifiers to make it easier to automate? How many APIs does the product have?	Are the automated checks ran as early as possible to provide rapid feedback? Does the team have regularly retrospectives on the automation efforts? Exisiting automation framework?	Has the project estimated for time to set up an automation framework? Does the project have budget for test environments?	Are there any known issues that would impact our automation efforts? Do we understand what risks need to be automated?	Does the existing pipeline contain any automated checks? Is there a pipeline already in place?	Does the automation efforts keep up each sprint? Are problems with the automation framework identified early?	Is there any monitoring in place for identifying potential production issues?	Anything learned from past projects / bugs? Learnings from past retros into next sprint

Is data viewable / queryable?

What is our tech stack?

What is the design / arch of the product?

How is data stored? Secure?

Do we have access to the database?

Do we have logs?

What kind of API / response format?

Can we test UI & backend separately?

3rd party integrations / services

User Access / Security

Accessibility testing

Performance / Number of users / Load / Support

What are our dependencies (internal / ext)

UI focus to test, or backend too?

User profile, registration, account (for test data)

UI flow / next step / UX

What does the client feel are most important features?

What is our customer support / availability

Usability (who are our users)

Date format / functionality

Time zones

Language / translations

Desktop vs Mobile - platforms / devices / browsers

Up time / downtime

Special characters support
